

Assignment Overview

You are a developer for the fintech application WebPe, a platform that offers student loans. Your task is to design and implement a complete onboarding experience, covering both frontend and backend development.

Onboarding Flow Requirements

The onboarding process must follow the sequence below:

1. Name: Collect the user's full name.
2. Email and Phone Number:
 - Collect both email ID and phone number.
 - Ensure uniqueness of these fields to prevent duplicate registrations.
3. Selfie Capture:
 - Activate the user's system camera.
 - Capture and save a selfie image as part of the KYC process.
4. Proof of Address Upload:
 - Accept one of the following official documents as proof of address:
 - Driving Licence
 - PAN Card
 - Aadhaar Card
 - Supported file formats: .png, .pdf

Approver View

In addition to the onboarding flow, implement an **Approver View** that allows authorized personnel to monitor incoming applications in real time. The approver should be able to:

- View all submitted user details captured during the onboarding process (Name, Email, Phone Number, Selfie, and Proof of Address).
- Approve or reject each application based on the submitted information.
- Ensure the interface is responsive and optimized for usability.

Technical Implementation

Frontend

- Use a modern, widely-adopted frontend framework such as **React** or **Angular**.

- Ensure responsive design to guarantee optimal functionality across various devices including desktops, tablets, and smartphones.

Backend

- Implement the backend using a robust programming language, preferably **Python**, **Java**, or **Node.js**.
- Data storage can be managed using a relational database or structured file storage, ensuring consistency and reliability.

Testing

- Conduct extensive testing of both frontend and backend systems to validate complete functionality.
- Ensure thorough checks for user interactions, data integrity, and scheduling logic.

Project Standards

- Develop the application following best coding practices to ensure maintainability, scalability, and readability.
- Maintain clear, structured, and well-documented code, explicitly detailing the logic and flow of the application.
- Implement comprehensive error handling to provide a robust user experience.
- Prepare the application to be production-ready, ensuring it meets professional quality standards.

Code Hosting

- Host your project code securely in a private GitHub repository, ensuring proper version control and accessibility for reviews.
- Deploy your project using platforms such as Vercel, Netlify, or any other hosting platform of your preference.
